Test Completion Date: 03/06/2012

This report contains in its entirety:
- Cover Page: 1 page
- Report Body: 7 pages
- Test Equipment: 1 page
- Photographs: 8 pages
- Drawings: 2 pages

Reference must be made to Report No. B7439.01-121-24, dated 03/13/2012 for complete test specimen description and detailed test results.
1.0 Report Issued To: Solatube International, Inc.
2210 Oak Ridge Way
Vista, California 92081

2.0 Test Laboratory: Architectural Testing, Inc.
130 Derry Court
York, Pennsylvania 17406
717-764-7700

3.0 Project Summary:

3.1 Introduction: This fire test standard aims to measure relative fire characteristics of roof coverings under simulated fire scenarios which originate outside the building. Under controlled laboratory conditions, the behavioral response of materials, products or assemblies as affected by heat and flame are described. The performances of the roof covering systems are described only under specific conditions. Information is not provided by these tests that are applicable to any scenarios other than the specific conditions experienced during testing. Information is not provided by these tests that are applicable to actual fire situations because of the inherent differences between the classes as it pertains to fire source and fire application; no comparison between the classes exist. Results from tests are applicable to the specifics of the test and the aspect in which the tests were conducted, and are not applicable to similar materials or the results of those materials when used in concert with other materials.

3.2 Product Type: Tubular Daylight Device

3.2.1 Series/Model: 330-DS

3.2.2 Series/Model: 750-DS

3.3 Compliance Statement: Results obtained are tested values and were secured by using the designated test method(s). This report does not constitute certification of this product nor an opinion or endorsement by this laboratory. It is the exclusive property of the client so named herein and relates only to the specimens tested. This report may not be reproduced, except in full, without the written approval of Architectural Testing, Inc.

3.4 Test Date: 03/06/2012

3.5 Test Sample Source: The parts for all specimens were selected by Keystone Certifications, Inc. personnel. The specimens were selected and permanently labeled on February 21, 2012 and initialed by “RLS.” Representative samples of the test specimen(s) will be retained by Architectural Testing for a minimum of four years from the test completion date.
3.6 Test Procedure: The ambient room temperature was between 50°F and 90°F as required by the ASTM E 108 standard. Samples and burning brands were exposed to a 12 mph wind for the duration of each test.

Burning Brand: A fire brand was constructed of nominal 1" by 1" by 6" strips of Douglas Fir forming a grid of approximately 6" square and 2-1/4" thick. The brand was placed and allowed to burn until all evidence of flame, glow and smoke had disappeared from the brand. At that time a second brand was placed at the same location and also allowed to continue burning until all evidence of flame, glow and smoke had disappeared. Upon client request, additional brands were placed on the test specimen for a sustained burn time of 60 minutes. Brands were placed horizontally on the flange of the specimen.

3.7 Test Equipment: The equipment used to conduct this test meets the requirements of ASTM E108-07a. The air speed was calibrated before the burning brand test. The test equipment and test apparatus descriptions are listed in Appendix A.

3.8 Drawing References: The test specimen drawings have been reviewed by Architectural Testing and are representative of the test specimen(s) reported herein. Test specimen construction was verified by Architectural Testing per the drawings located in Appendix C. Any deviations are documented herein or on the drawings.

3.9 List of Official Observers:

<td>Product consisted of 0.042 in. thick steel flashing, 0.035 in. thick steel edge protection band, extruded plastic tube ring and a nominal 0.15 in. thick light diffusing plastic dome.</td>
</tr>
</tbody>
</table>

6.0 Roof Deck Construction: The test decks were constructed on 2x4 pine lumber spaced 24 in. on center. A non-combustible roof deck was constructed of nominal 5/8 in. thick Type X gypsum board under a 1/4 in. thick fiber cement board. A 22-1/2 in. hole, centered horizontally and vertically on the deck, was cut to allow installation of the product.

7.0 Installation: The products were installed by a Solatube representative. The products were secured to the test deck with (16) #10 by 2 in. long pan head fasteners evenly spaced around the circumference of the mounting flange, each approximately 3/4 in. from the edge. The plastic tube ring and dome were set on the flashing and secured with (3) #8 by 1.5 in. long pan head fasteners evenly spaced around the dome and a steel dome edge protection band. No sealant was used in the installation between the flange and the test deck.
8.0 Test Results: The results are tabulated as follows:

Calibration Information:  
Average Wind Speed: 1043 ft./min.  
Ambient Temperature: 63°F

Burning Brand: 

Placement of Brands: Centered horizontally, 10 in. from the leading edge of the deck, on the flange of the product. The 2-1/4" side of the brand was against the vertical flange of the skylight. 

Average Brand Weight: Brands were verified to be 2000±150g at the time of test

<td>60:00</td>
</tr>
</tbody>
</table>

Conclusions: Pass
1. No portion of the skylight formed a glowing brand that continued to glow after reaching the floor.
2. The brand did not burn through the product to expose the roof deck.
3. No sustained flaming was observed on the underside of the deck or product.
4. No flames were spread to the plastic dome.
